

Metso

MP XM Series crusher upgrades

Xtreme forged head

The Xtreme forged head is available for Nordberg™ mining duty crushers of HP800 or MP800 size and larger.

The Xtreme forged head provides the most durable head designed for the most demanding of crushing applications, lasting up to 3 times longer than the standard cast head.

Challenges

As ore bodies change and demand increases on your crushing plant, your Nordberg™ crushers can be pushed to and beyond their operational limits. In cases where particularly hard ores exist or the machines are continuously run at their limits, this can cause damage to crusher heads and related components. You need a reliable head that can handle these operational demands.

What it is

Created from a single forged ingot, the Xtreme forged head provides the most durable head offered by Metso. Fully forged and machined, this head has been designed to handle the needs of the most demanding operations around the globe. When your application or operational goals are pushing the crushing equipment to their absolute limit, the forged head provides the best solution for your crushing needs. The Xtreme forged head also comes with a three year warranty.

How it helps

Maximize production

Metso knows that you need your crusher to be able to handle the stresses your production demands from your equipment. When your application may be inadvertently pushing your machine to its absolute limits, the Xtreme forged head provides the solution you need to meet demands.

Improved safety

Improved durability of your crusher components equates to less need for your maintenance crews to intervene for unplanned downtime. This keeps your teams focused on planned repairs and maintenance where risks can be controlled and averted.

Sustainability advantage

By extending the life of your heads, you use less parts during normal operation and produce less waste from your mine site, helping you meet sustainability targets. The Xtreme forged head equates to maximum productivity with the least waste.
